Cut Micro allows you to simulate and design the cutting pattern of wood or composite panels. The software is completely Open Source and it is released under GNU General Public License. Cut Micro Features:

- * It is a tool to calculate the optimal cutting pattern and thickness of a rectangular panel.
- * The calculation of the optimal cutting pattern is done by selecting the pivot point for each edge and the cutting angle. It is possible to select between positive or negative cutting angle, which you can refer to as the shearing cut.
- * The software performs an optimization of the cutting pattern and generates a database of the best cutting patterns and the respective thickness.
- * The program calculates the best thickness and cutting pattern for each side of the panel, but the maximum number of sides of

the panels which will be cut can be selected. * The size of the cutting pattern is calculated as a function of the material properties selected: material type (trees, glass, metal) processing method (trued, splitted, sliced...) number of pieces number of recesses clearance between the pieces Comparison between the results of the program and the results of a specialist can be made and a report can be made. Cut Micro has been tested and works with small home panels of up to 8"X4"X1/4", but it will be fast enough to calculate the optimal cutting patterns for home made panels of up to 8'X8'X1/4'. This preview video shows a set of panels which were calculated, but it will be a good idea to experiment with the program, since it may vary from panel to panel and depends on the specific material selected. Cut Micro versions: Cut Micro is a java application so there are currently many different versions of it,

You have the right to know what "Community" means! A community is a group of people united by

similar interests. Wikipedia says it like this: Community (in anthropology) is a living organism that is distinct from the individuals or groups who make up its membership. Community (in sociology) is a group of people who share a social identity and an allegiance to the same values. Community (in online communities) is a network of people sharing a common interest who interact on a regular basis. Community (in psychology) is a group of people who share a common interest who interact on a regular basis. In other words... "Community" is something you are born with, just like "friendship" or "spouse". In my book, "Community" is not a product you purchase to create on your own. It's already there; you have to use it. Not every place on the Internet is a community. The community you are trying to build isn't the ones you can find with Google. You have to find your community. That's

the hard part. Everyone wants to be a part of something big. That's why we are here. Community. Why do you think people are getting their own communities? First of all, there is a huge demand. The second reason is that people are frustrated with what other people are sharing, creating, or thinking about. And the third reason is a bit more personal. If
