WebMD Category:Hospital networks Category:Medical and health organizations based in Florida Category:1995 establishments in Florida Typical known processes for producing perfluoroethers include the reaction of an ether with a perfluoroorganic compound, and the reaction of an alkene with a perfluoroorganic compound. The reaction of an ether with a perfluoroorganic compound is known, for example, from U.S. Pat. No. 3,970,723, and this reaction produces a mixture of various ethers, in addition to the desired perfluoroether. Furthermore, the reaction of an alkene with a perfluoroorganic compound produces a mixture of various ethers, and a perfluoroether as well as other compounds. U.S. Pat. No. 3,970,723 describes the reaction of an organic compound having at least two active hydrogen atoms and at least two perfluorinated carbon atoms with a perfluoroorganic compound having at least one active hydrogen atom, such as a perfluoroalcohol, in the presence of a diluent. The desired perfluoroether is obtained by distilling off the solvents. U.S. Pat. No. 3,970,723 discloses that the molar ratio of ether to perfluoroorganic compound can be varied from about 1:1 to 10:1. For each mole of ether, the reaction produces one mole of the desired perfluoroether and about 0.5 to about 5 moles of unre f988f36e3a
