I've a very big and complex.net 3.5 project running on windows 7 64bit. I would like to port it to.net 4.0 but I'm bit in doubts whether I need to update my references to be.net 4.0 compatible. Since that is a very complex project I wanted to know if I need to go through the project one by one and update all the assembly references to be 4.0. A: It really depends on what you are doing in your application. For example if you are doing.net reflection, I would recommend looking into stuff like IronPython where there is no.NET framework dependent on the CLR you are running on and also other areas of.NET such as WPF, Mono etc where the framework isnt really.NET but the developer can target.NET and not be forced to stick to an older version of the framework. I would recommend having a look around the csproj files and try to see what the different project references look like. The csproj files look just like what you would see if you were building a.NET 3.5 or 3.0 application and the reference tags just reflect what framework you are using. for example in a.NET 3.5 and 3.0 there is the tag and in.NET 4.0 there is etc.
