Bitcoin is a cryptocurrency and a digital payment system invented by an unknown person (or persons) under the name Satoshi Nakamoto and released as open-source software in 2009.[1] Bitcoins are created as a reward for a limited pre-defined number of "miner" computational "shares" (or h-mines) in the founding block. They can be exchanged for other currencies, products, and services.[2] Some people may use the term Bitcoin to refer to the technology behind the currency itself, and the term altcoin to refer to any cryptocurrency that is not Bitcoin.[3] Bitcoin is used as a means of payment in certain ancillary transactions that are an example of microtransactions.[23]:22 In the process of generation, there is a gradual reduction in the number of bitcoins that will be released. This reduction was introduced in order to encourage miners to dedicate their computational power to mining instead of gathering additional bitcoins.[23]:22 The bitcoin protocol provides the means of accepting transactions to the network, as well as the reward for mining through "proof-of-work."[23]:22 Every transaction is confirmed by the network and recorded in a public distributed ledger called the blockchain. That about covers it. The process of mining bitcoins is explained below. Bitcoin and crypto currency

mining are both relatively new, and under a lot of development. Both processes are still technically in the relatively early stages of development, and as such, have left many questions open. The process of mining is still a relatively new concept. Originally, it was viewed as a slow and laborious process, but with the introduction of highly automated processes and on-line mining, it has become a fast and relatively high-yielding process. ASICS, as well as other brands. has been known for their bad looking shoes for a while now. Their baseball spike shoes were definitely worth nothing. The supposedly good looking women Adidas football nhl, however, have been worth more than the shoes. This
