BinText is a tiny and portable piece of software developed for programmers who want to extract text from various file types and locate ASCII code, Unicode and Resource strings. Since installation is not required, you can simply drop the executable file anywhere on the hard drive and run it. But you may also save BinText to a USB flash drive or other similar storage device, and run it on any computer. Therefore, you can keep the tool in your pocket whenever you're on the move. The most important aspect is that the Windows Registry section is not updated with entries (thus, reducing the risk of system errors), and files are not left behind on the hard drive after removing the app. The interface of the tool is made from a standard window with an uncomplicated layout. Loading a file into the workspace is done with the help of either the file browser or "drag and drop" method. BinText shows the file and memory position, ID, text, elapsed time and text size for each resource, together with the ASCII, Unicode or Resource value. It is possible to use a search function and to save details to a plain text document (TXT) for further analysis. Moreover, you can filter the scanning procedure by specifying the characters included in a string's definition, string size and mandatory items included. These options may be restored to their factory values. The straightforward program runs on a pretty low quantity of CPU and system memory, so it doesn't affect the computer's performance. It has a good response time and scans files rapidly, without making Windows hang, crash or pop up error dialogs. Although the app has not been updated for a pretty long time, BinText supplies programmers with a simple solution to gather resources from a file. What's New In BinText?

BinText scans any text-only file. It provides a helpful interface that includes time duration, memory usage and file data for each resource, together with the ASCII, Unicode or Resource value. BinText Review: BinText is a lightweight text scanning utility that can help you quickly analyze any text-only file. BinText has two modes: a basic scan, which utilizes only the number of characters specified in the string; and a more complex scan, which shows the required characters and the number of instances of each character. The latter mode is helpful for extracting characters from text files that have complicated or unusual strings. You can search through resources to locate any given value. The app supports multiple files and non-empty folders. BinText can also scan files and folders that contain non-text files. All resource values are output to a log file. BinText has not been updated for a while, but it still works properly. BinText requirements: Windows 98/Me/2000/XP/2003 BinText uses a pretty small amount of system resources, therefore it doesn't consume much memory. It doesn't use multiple threading, so the app won't hang your computer or stop responding. BinText saves the results of a scan to a temporary text file, which is located on the Windows system in the folder c:\windows\temp. To get rid of this folder, go to the location c:\windows\Temp\ and click on the Delete button. BinText is intended for programmers and other information gatherers.
